Put down the finished cube. The 8 should be facing the ceiling. The north should be pointing away from you. Twist the cube by 90° clockwise. Tilt it onto the side that's in the west. The upward-facing number is A. Twist the west away from you. Tilt the cube towards north, twice. Tilt it towards east, twice, then towards west. Which number is now on the cube's downside? That's B. Twist the south to the right. Tilt the cube onto its left side. C is the sum of the numbers that are visible on the cube's left and right side. Tilt it in a way that hides the 4 underneath the cube. Starting from the now upward-facing number, which number is one step to the west and one more step to the east? This number is D.

1. When the moon stands in Uranus and the sun in south-west, look east.

2. When water stands in Neptune and thunder strikes in the north look west.

3. When the sun stands in Mars, and the moon in south-east, look south.

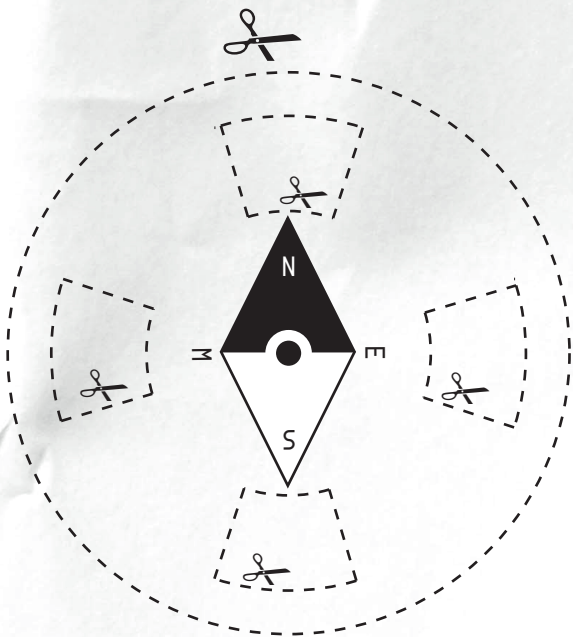

4. When the moon stands in Mercury, and water in the west, look east.

5. When earth stands in the north, and the moon in Mars, look south.
